EDUCATION

Bachelor of Science in Computer Science & Software Engineering

August 2023

University of Washington | Cumulative GPA: 3.55

Relevant Coursework:

*Data Structures & Algorithms, Operating Systems, Network Architecture
Computer Vision, Computer Architecture, Database Systems, Web Development*

TECHNICAL SKILLS

Developer Tools:

Git, GitHub, Linux, Azure, C++, Java, Python, PostgreSQL, JavaScript, HTML, CSS, React.js, Spring Boot, Django, REST API, OpenCV, Azure DevOps, Hugging Face, Microservices, API Gateways, Load Balancer, Google Collab, Jupyter Notebook, Docker, Maven, Node.js, JUnit, Tomcat, Postman, C#, SQL Server, .NET, Hibernate, OAuth 2.0, HTTP, Serverless, Agile Methodologies, CI/CD

EXPERIENCE

CS Peer Facilitator & Grader | University of Washington | Bothell, WA

Summer 2023

- Assisted students in understanding the importance of encapsulation and data abstraction within the C++ programming language, for achieving a clean separation of concerns and promoting code reusability.
- Grade assignments and mentor students through hands on projects to help them improve their skills.

TECHNICAL PROJECTS

Fitness Daily | Spring Boot | React | PostgreSQL | Docker | REST API

Spring 2023 - Present

- Developing a fitness app using Spring Boot's MVC design to build robust RESTful APIs, React.js to craft a user interface, and Docker to containerize the PostgreSQL database for optimal efficiency and scalability.
- Designed personalized workout creation, calorie & nutrition tracking, and exercise management with an avatar muscle selector through RESTful API endpoints.

Airport Flight Tracking System | PostgreSQL | C++ | Linux | Git | OOP

Winter 2023

- Developed a flight tracking system using C++ API "libpqxx" to provide airport employees with a shell-like UI for tracking flights, updating flight information, and adding new information such as passengers and cargo.
- Designed a comprehensive database schema using normalization techniques to ensure efficient storage and retrieval of all relevant flight information.
- The schema includes multiple tables with specific relations to minimize redundancy and ensure data integrity, resulting in faster query processing and easier database maintenance.

Road Sign Detection | C++ | OpenCV | Windows | Git

Fall 2022

- Developed a road object detection to detect and identify American regulatory signs (Traffic Light, Stop Sign, Pedestrian Sign, and Speed Limit Sign) through image recognition.
- Implemented detection of multiple traffic signs according to their HSV values without training the model.

The Jolly Banker | C++ | Linux | Git | OOP

Fall 2021

- A banking application that processes and stores transactions from a file in an in-memory queue
- Used queues and binary search trees to manage and process transactions, including account opening, fund deposits and withdrawals, fund transfers, and transactional history printing.

RESEARCH

Bioinformatics Research | HTML | CSS | JavaScript | Django | Git

Summer 2023

- Collaborated on iBioML website development, bridging Data providers and Machine Learning Engineers.
- Utilized OAuth 2.0 and REST API for third-party software authentication, authorization, and integration.
- Optimized project proposal submission, simplified dataset access, and refined collaboration workflows.
- Contributed to machine learning model development by applying data preprocessing techniques, including feature engineering and data cleaning, to prepare datasets for training.
